

How to add SSL certificate with application Server:

This document will guide how to add an SSL certificate to our application server. We have React Js application that is running over the Amazon EC2 Ubuntu machine. I am assuming you have a basic knowledge of Node JS and Amazon EC2 service.

Following tech we are using in our senrio.

1. Amazon EC2 (Ubuntu Machine)
2. Nginx for Proxy Purpose
3. Node JS
4. React JS App
5. SSL Certificate by using the **Let's Encrypt**

Provisioned EC2 machine using the Ubuntu AMI. Attached the Security group that have HTTP and HTTPS access.

EC2 > Instances > i-054dac3e2032356cc		
Instance summary for i-054dac3e2032356cc (Iftikhar-Test) Info		
Updated less than a minute ago		
<div>Refresh</div> <div>Connect</div> <div>Instance state ▼</div> <div>Actions ▼</div>		
Instance ID i-054dac3e2032356cc (Iftikhar-Test)	Public IPv4 address 52.91.217.23 open address	Private IPv4 addresses 172.31.4.156
IPv6 address -	Instance state Running	Public IPv4 DNS ec2-52-91-217-23.compute-1.amazonaws.com open address
Hostname type IP name: ip-172-31-4-156.ec2.internal	Private IP DNS name (IPv4 only) ip-172-31-4-156.ec2.internal	Elastic IP addresses -
Answer private resource DNS name IPv4 (A)	Instance type t2.micro	AWS Compute Optimizer finding No recommendations available for this instance.
Auto-assigned IP address 52.91.217.23 [Public IP]	VPC ID vpc-17cf9272	Auto Scaling Group name -
IAM Role -	Subnet ID subnet-425f3135	

Install the Nginx over the EC2 machine using the following commands:

```
sudo apt update
sudo apt upgrade
```

Install the Nginx service over the machine

```
sudo apt install nginx
```

```
sudo systemctl status nginx
```

Install Node JS over the EC2 machine:

```
sudo apt install nodejs
```

node -v

```
sudo apt install npm
```

Clone the ReactJS App code over the EC2 Machine using the following command:

git clone <https://github.com/sobankhan12/bootcamp-shoe-store.git>

```
cd bootcamp-shoe-store/
```

npm start

PM2 is a production process manager for Node.js applications with a built-in load balancer. It allows you to keep applications alive forever, to reload them without downtime and to facilitate common system admin tasks.

npm install pm2 -g

This command will start the ReactJS App at background.

pm2 start npm -- start

The Node JS application will start working on port 3000

PublicIP:3000

Add the Proxy configurations in nginx service default file. So it will redirect the application over the http and https.

```
location / {  
    proxy_pass http://localhost:3000;  
    proxy_http_version 1.1;dd  
    proxy_set_header Upgrade $http_upgrade;  
    proxy_set_header Connection 'upgrade';  
    proxy_set_header Host $host;  
    proxy_cache_bypass $http_upgrade;  
}
```

The last step is to add the SSL certificate with Nginx service.

<https://certbot.eff.org/instructions?ws=nginx&os=ubuntu>

We will use the Let's Encrypt for generating the SSL certificate.

Install snapd:

Snapd allows upstream software developers to distribute their applications directly to users.

```
sudo apt install snapd  
sudo snap install core; sudo snap refresh core
```

Install Certbot

```
sudo snap install --classic certbot
```

Prepare the Certbot command

```
sudo ln -s /snap/bin/certbot /usr/bin/certbot
```

It will add the following configuration over the nginx default file.

```
{  
    listen 443 ssl;  
  
    server_name soban.store;  
  
    ssl_certificate /etc/letsencrypt/live/soban.store/fullchain.pem; # managed by Certbot  
    ssl_certificate_key /etc/letsencrypt/live/soban.store/privkey.pem; # managed by Certbot  
  
    ssl_protocols TLSv1 TLSv1.1 TLSv1.2;  
    ssl_prefer_server_ciphers on;  
    ssl_ciphers 'EECDH+AESGCM:EDH+AESGCM:AES256+EECDH:AES256+EDH';
```

}
